

## PLASTIC MATERIALS MADE BY CNC MACHINERY

The products are based on drawings and they are obtained through CNC machines in various plastic materials including standard bars or semi-finished blocks on the market.

The Sargomma plant is equipped with high precision and productivity machinery, which enable us to manufacture complex parts while maintaining very small tolerances for processing through: cutting, milling, turning, shearing, drilling and grinding.

We use semi-finished material with no internal tensions, which is a necessary condition for obtaining parts with narrow and dimensionally stable tolerances.
